Sprint2 Planning

Jodie Butterworth

CPT_S 322 Project

Goals:

Get the front end of the website up with working links between all the major pages. Pages should scale and adjust based on the window size and be easy to navigate. Every page should be accessible from the homepage, and the title and logo should link back to the homepage.

Start on the database and make it specific to the user. The user should be able to edit their data and save the changes.

Completion of the UI for the major site pages is higher priority than the creation of the database.

The initial UI page will be the hardest and most time consuming with the other pages reusing features and linked to the same css.

The database will be difficult to keep and link securely, and improvements to security may need to be made after the database is working. It would be better to start with a secure format though.

To state the obvious, Jodie Butterworth will be doing these changes.

Features:

F1) Homepage with the links done and stable and usable in windows of multiple sizes. (unfinished from Sprint1). High Priority.

F2-F5) Working pages for the blog, forum, scholarship and web classes pages with working links and usable in windows of multiple sizes. High Priority.

F6) Working dialogue box to view and edit user data under options drop-down menu. Secure and edits only the logged in user's data. Medium Priority.

Acceptance Criteria:

A1) All major site features accessible from homepage, homepage is easy to navigate and read, homepage adjusts layout based on the window size. High Priority.

A2-A5) Major feature pages working and legible, all links working but not all database features, easy navigation between pages, page layout adjusts based on the window size. High Priority.

A6) User dialogue box appears when selecting user profile from the options drop-down menu, dialogue box scales and adjusts with window size, user can edit their data and save the edits, user can edit only their data, dialogue box closes on submit. Medium Priority.
